# Current Operational Regional Hurricane Models at NWS/NCEP: HWRF & HMON

## HWRF:

- WRF-NMM+MPIPOM/HYCOM+WWIII Coupled System
- Triply nested 13.5/4.5/1.5 km resolution w/91 levels
- 4D Hybrid EnVar DA System with Vortex Initialization, RTOFS for Ocean Initialization
- Advanced Physics
- All Global Basins (NHC and JTWC), max. 7 storms on-demand

## HMON:

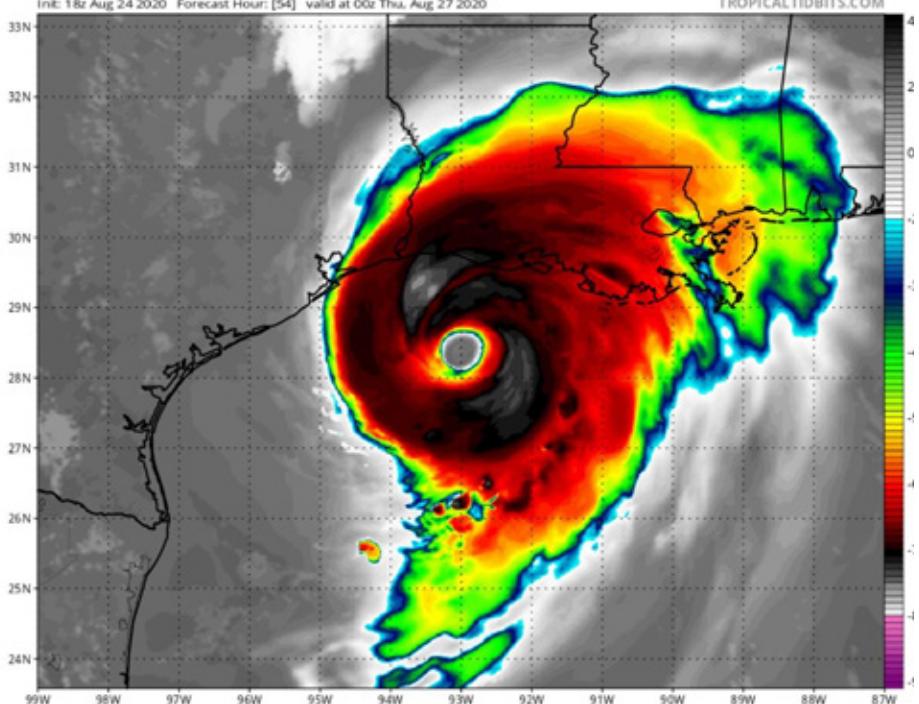

- NMMB+HYCOM Coupled System
- 18/6/2 km resolution w/71 vertical levels
- Advanced Vortex Initialization, Advanced Physics
- RTOFS for Ocean Initialization
- NHC Basins, max. 5 storms on-demand

# **FY20 HWRF/HMON Operational Performance**

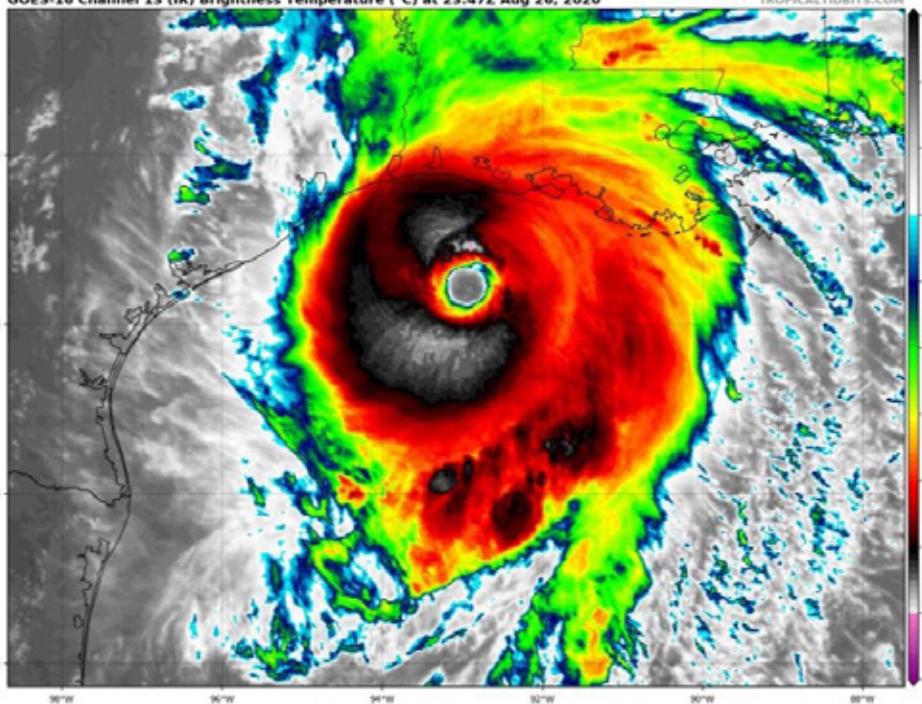

HWRF LAURA-13L Simulated IR4 Brightness Temperature (°C)  
Init: 18z Aug 24 2020 Forecast Hour: [54] valid at 00z Thu, Aug 27 2020

TROPICALTIDBITS.COM

GOES-16 Channel 13 (IR) Brightness Temperature (°C) at 23:47Z Aug 26, 2020

TROPICALTIDBITS.COM

Comparison between HWRF's forecast @ 54 hrs (left panel) and the actual satellite image (right) from GOES-16 nearing Laura landfall.

Thanks Levi Cowan!

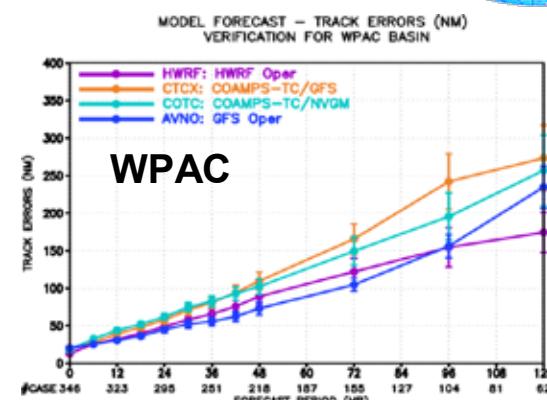

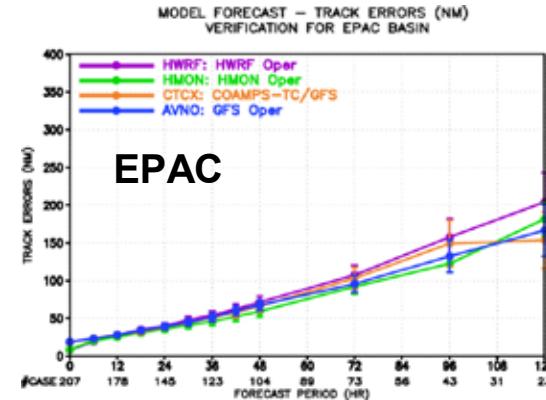

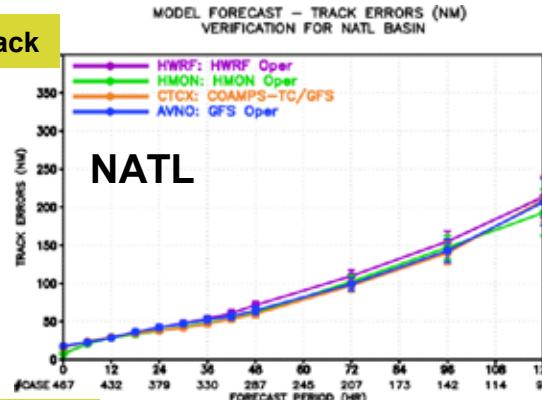

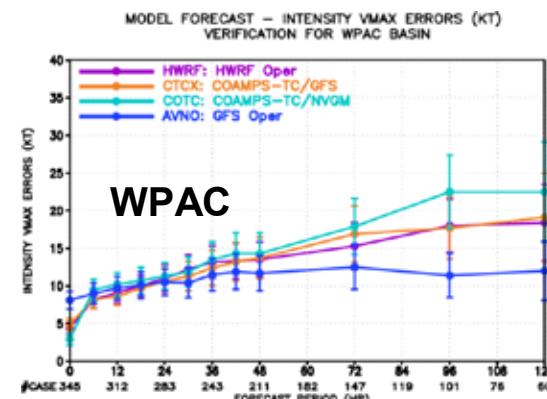

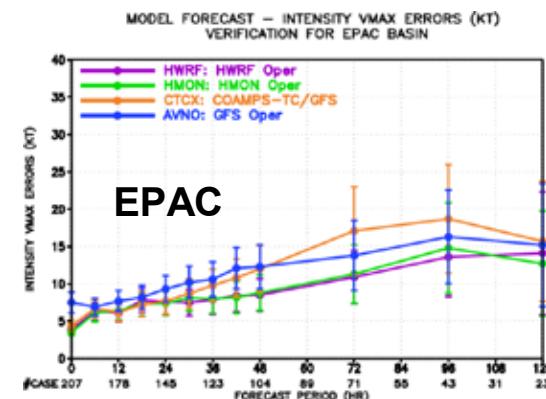

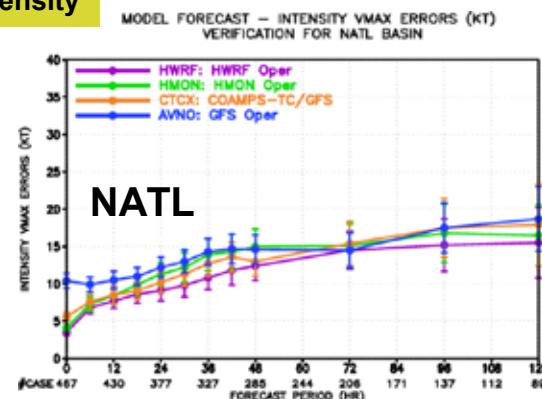

# Operational GFS/HWRF/HMON vis-à-vis Dynamic Models: Track and Intensity Errors for 2020 (Late Results)

## Track

## Intensity

## Operational GFS, HWRF and HMON for 2020 Season: Highlights

### ❖ NATL Basin:

- ❖ Operational HWRF has the **best intensity skill** for all lead times. Average max errors are ~ 15 kts at Day 5
- ❖ Operational HMON has the **best track skill** for Days 4 and 5 with GFS a close second.
- ❖ Overall -- HWRF intensity performance was outstanding in the Gulf of Mexico (not shown).

### ❖ EPAC Basin:

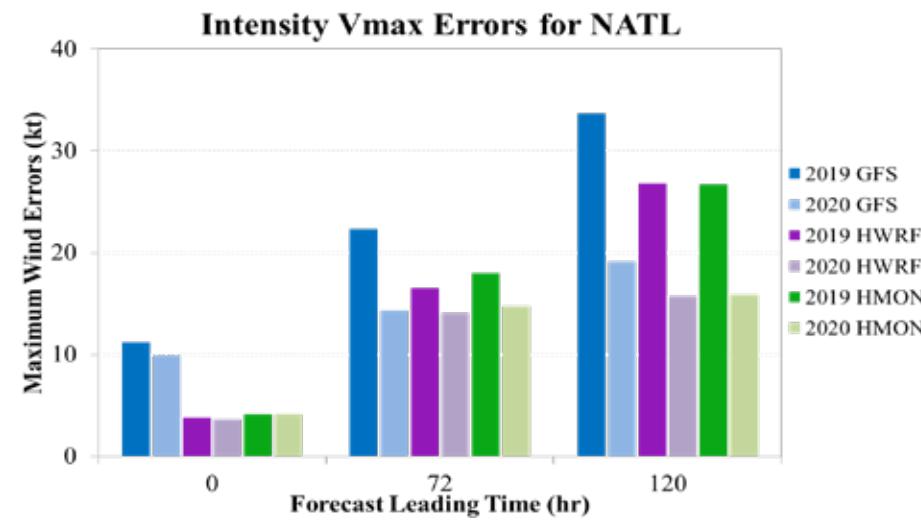

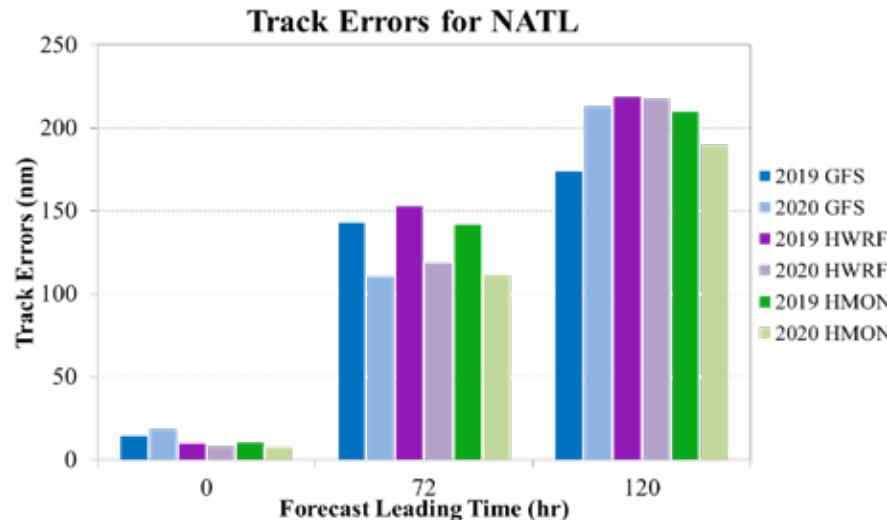

- ❖ Both Operational HWRF and HMON have the **best intensity skill** by far for all lead times. Again, average max errors ~ 15kts.
- ❖ Operational HMON and GFS had the lowest track errors.
- ❖ EPAC had much fewer storms this year.

### ❖ WPAC Basin:

- ❖ Operational GFS has the **best intensity skill** at all lead times.
- ❖ Operational GFS has the **lowest track errors till Day 4**; HWRF has the **best track skill at Day 5**

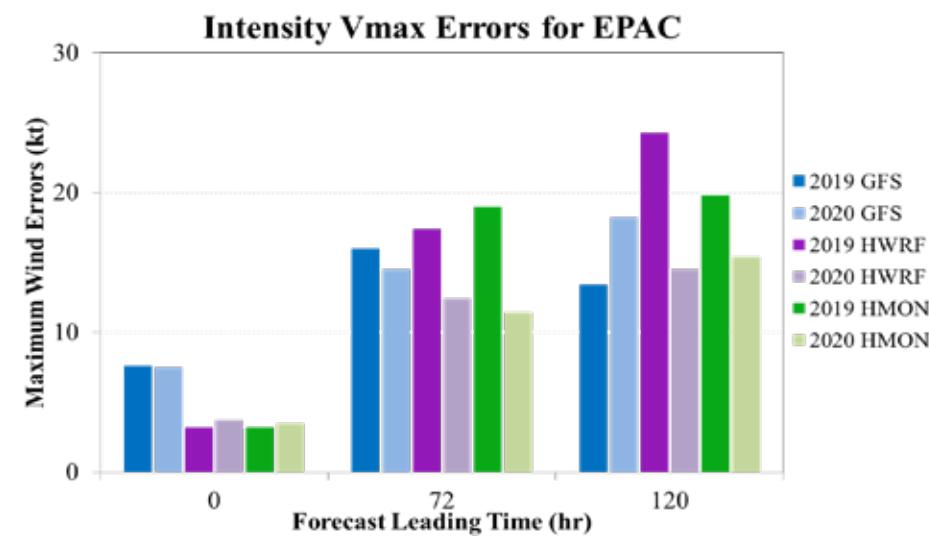

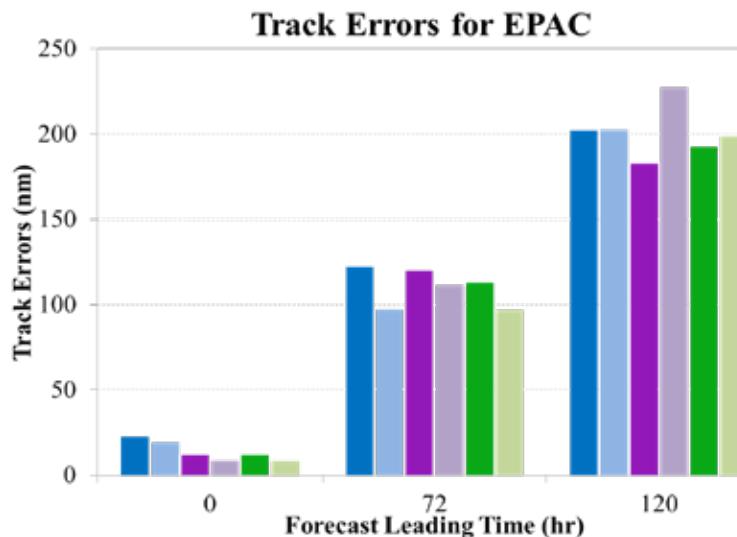

## Operational GFS, HWRF and HMON for 2020 Season: NATL Basin

Track errors show very **good improvements** for 72 hr forecasts while intensity errors show **excellent improvements** for both 72 hr and 120 hr forecasts in the NATL basin for the 2020 season.

## Operational GFS, HWRF and HMON for 2020 Season: EPAC Basin

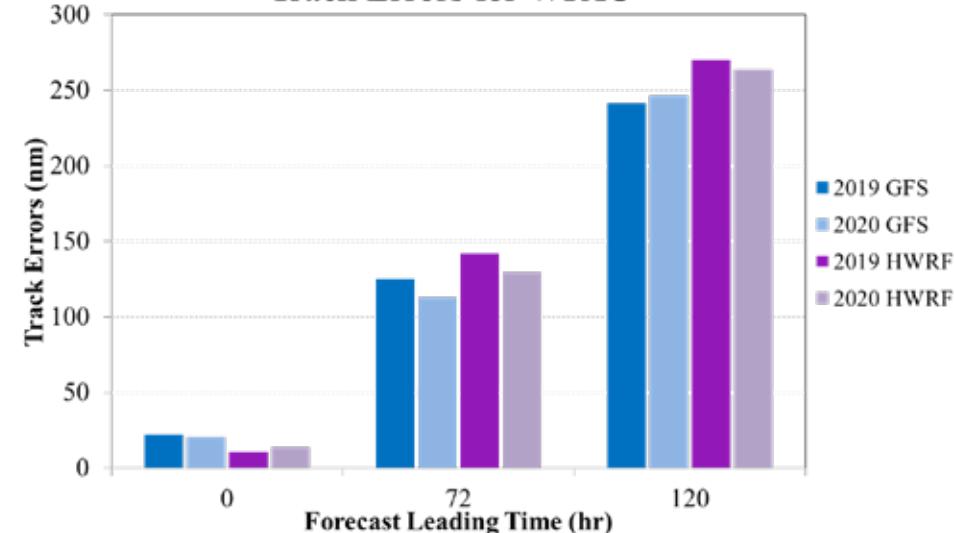

Track errors show **very good improvements** for 0 and 72 hr forecasts while intensity errors show **excellent improvements** for 72 and 120 hr forecasts (for HWRF & HMON) in the EPAC basin for the 2020 season.

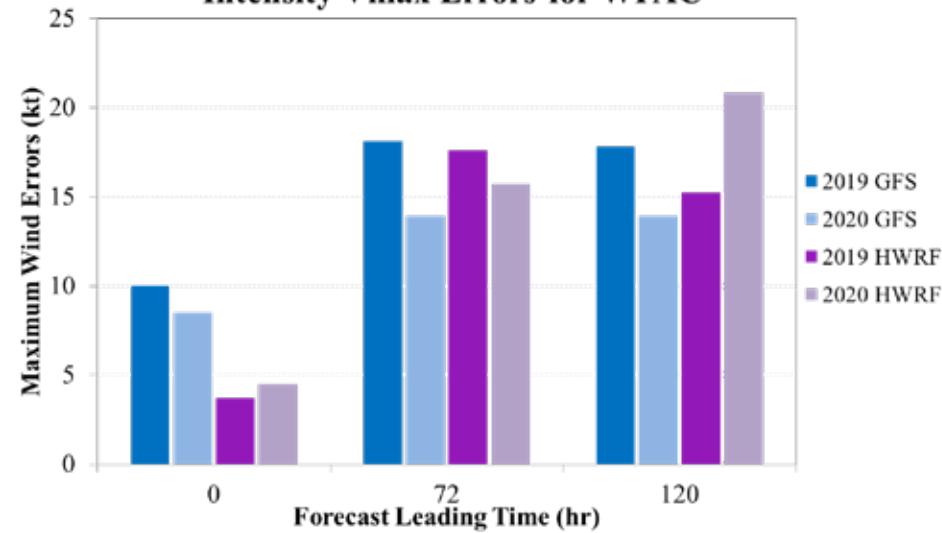

## Operational GFS, HWRF and HMON for 2020 Season: WPAC Basin

### Track Errors for WPAC

### Intensity Vmax Errors for WPAC

Both track and intensity errors show **good improvements** for 72 hr forecasts in the WPAC basin for the 2020 season. For 120 hr, results are mixed -- GFS gave us reduced intensity errors for this basin but HWRF errors were higher.

# **FY21 HWRF v13.1.0 and HMON v3.1 Upgrades**

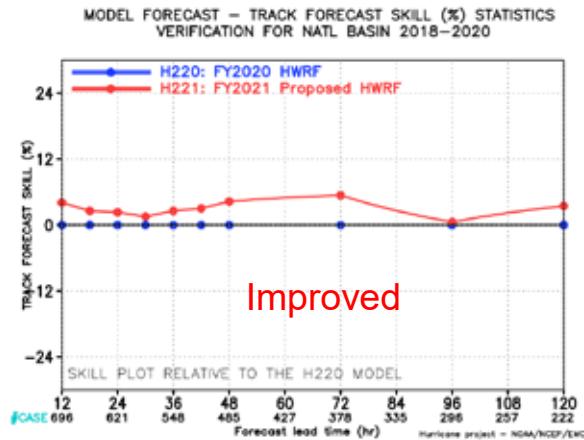

# Retrospective testing with inputs from: GFS v16 and RTOFS v2

- ❖ Upstream data input: GFS v16 (**Feb. 2021**) and RTOFS v2 (**Dec. 2020**)
- ❖ T&E Period: Most of the TCs in 2018-2020 for NATL, 2019-2020 for EPAC
- ❖ H221/M221: HWRF/HMON driven by GFSV16 and RTOFS
- ❖ H220/M220: Current operational HWRF/HMON

# H221: HWRF (with GFS v16) vs H220: Operational HWRF

# GFS v16 Downstream Impacts on Hurricane Forecast Models

## Impact on HWRF

	Track Forecast	Intensity Forecast	P-W relationship	RI POD/FAR
NATL	Positive at all lead times (~5%)	Positive at most of the lead times, except for marginally negative at day 1 and 5.	Improved	Improved POD/FAR
EPAC	Significantly positive at all lead times, >20% at day 4-5	Neutral overall. Negative between hrs 30-60 but positive for longer lead times at Days 3-5.	Neutral	Degraded POD/FAR

## Impact on HMON

	Track Forecast	Intensity Forecast	P-W relationship	RI POD/FAR
NATL	Negative at all lead times after day-1 (<~5%)	Positive at all lead times, ~10% between day 2-4	Improved	Degraded POD Neutral FAR
EPAC	Significantly positive after day 1, >10% at day 4-5	Neutral before day 3, Significantly positive at day 4 and 5 (>20%)	Improved	Improved POD/FAR

Note: H221/M221 Produce stronger storms than H220/M220

# HWRF/HMON Configuration (maintain diversity)

Note: Items in Red are different

	HWRF	HMON
Dynamic core	Non-hydrostatic, NMM-E	Non-hydrostatic, NMM-B
Nesting	13.5/4.5/1.5 km; 77°/18°/6°; 75 vertical levels; Full two-way moving	18/6/2 km; 75°/12°/8°; 71 vertical levels; Full two-way moving
Data Assimilation and Initialization	Vortex relocation & adjustment, Self-cycled hybrid EnKF-GSI with inner core DA (TDR)	Modified vortex relocation & adjustment, no DA
Physics	Updated surface (GFDL), GFS-EDMF PBL, Updated Scale-aware SAS, NOAH LSM, Modified RRTM, Ferrier	Surface (GFDL), GFS-EDMF PBL, Scale-aware SAS, NOAH LSM, RRTM, Ferrier
Coupling	MPIPOM/HYCOM, RTOFS, WaveWatch-III	HYCOM, RTOFS, No waves
Post-processing	NHC interpolation method, Updated GFDL tracker	NHC interpolation method, GFDL tracker
NEMS/NUOPC	No	Yes with moving nests
Computation cost for forecast job	91 nodes in 98 mins	43 nodes in 100 mins*

# Future Implementations/Plans

Transition to UFS Applications

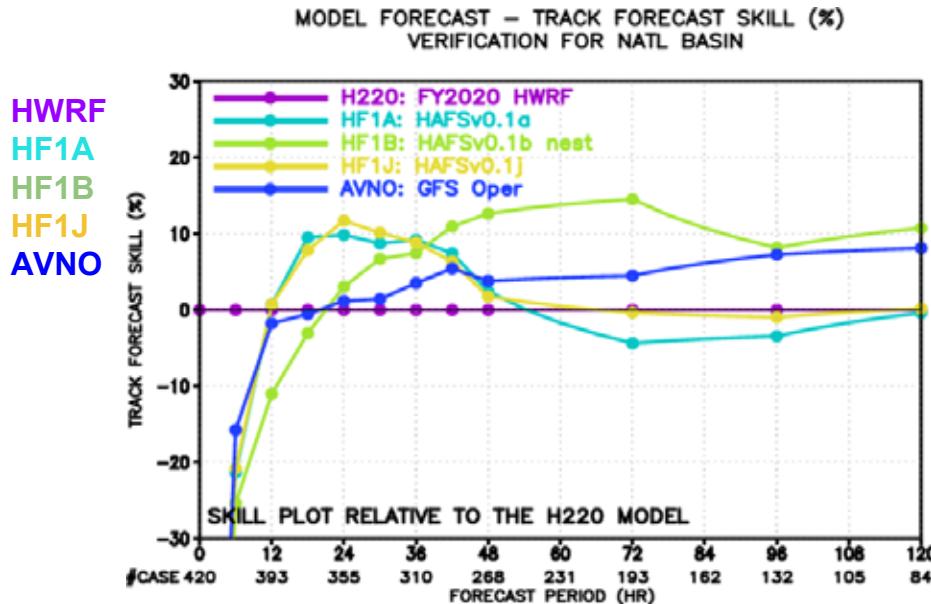

# Planned 2020 HAFS Real-time Experiments

1. **HAFS v0.1A:** FV3-based Stand-Alone Regional HAFS in the NATL basin with ocean-coupling.
1. **HAFS v0.1B:** FV3-based Global HAFS with high resolution static nest nest in the North Atlantic Basin
1. **HAFS v0.1E:** FV3-based Stand Alone Regional HAFS Ensemble Prediction System Experiment for the North Atlantic Basin
1. **HAFS v0.1J:** FV3-based Stand Alone Regional HAFS with the new Extended Schmidt Gnomonic (ESG) grids for forecasts in the North Atlantic and North-East Pacific Basins.

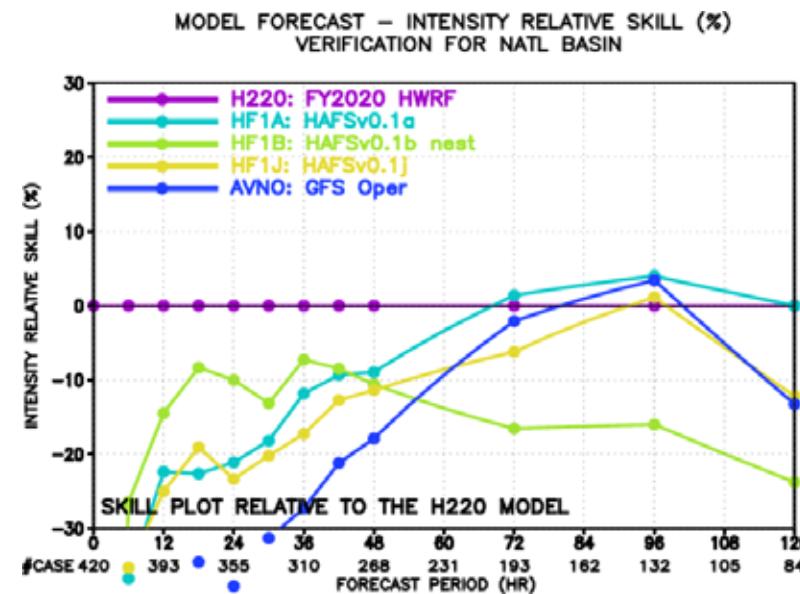

# HAFS Performance for 2020 NATL Storms (03-30L)

## Track skill

## Intensity skill

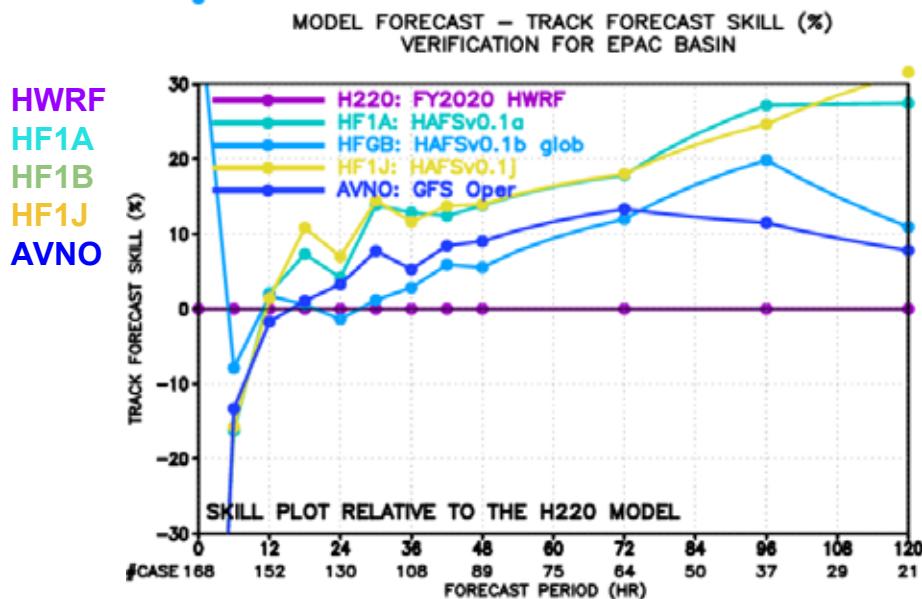

HAFS-B (nest) had the best track skill overall followed by HAFS-J and HAFS-A. All HAFS configurations lag in intensity skill behind operational HWRF for early lead times. HAFS-A catches up to HWRF by Day 3.

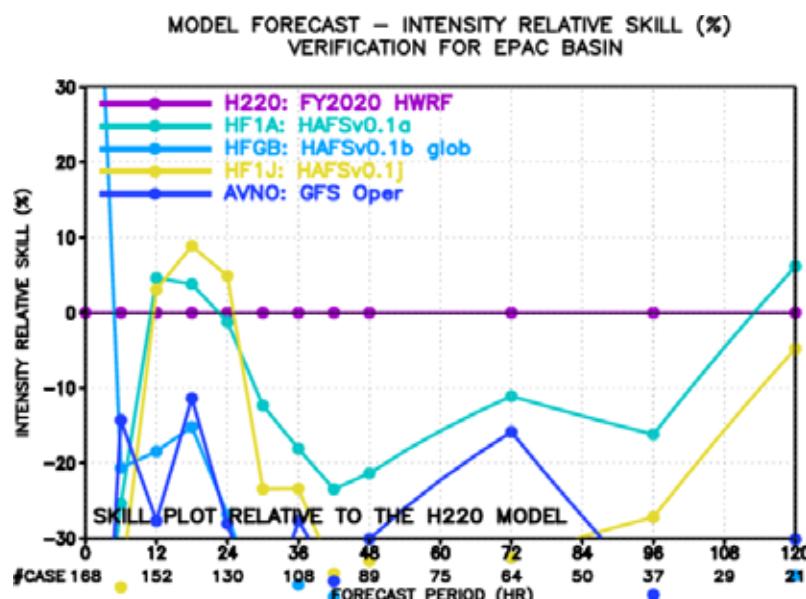

# HAFS Performance for 2020 EPAC Storms (03-19E)

## Track skill

## Intensity skill

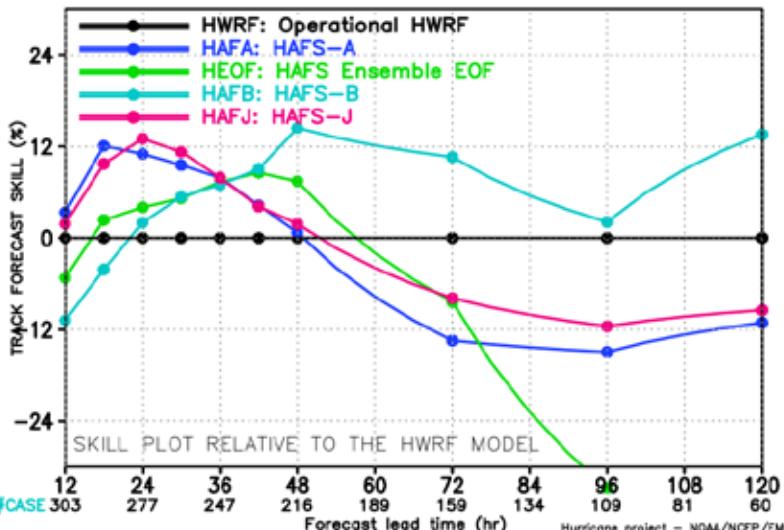

HAFS-A and HAFS-J had the best track skill followed by HAFS-B (global). All HAFS configurations lag in intensity skill behind operational HWRF.

# HAFS v0.1E Performance for 2020: NATL Basin

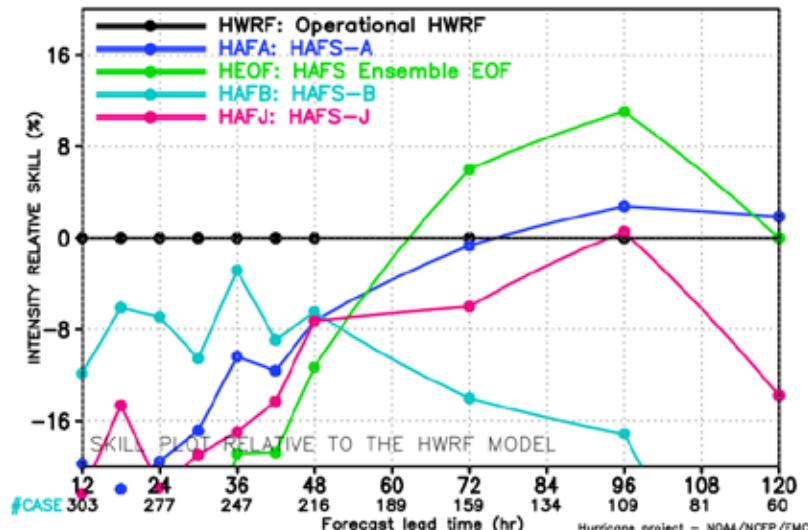

## Track skill

MODEL FORECAST – TRACK FORECAST SKILL (%) STATISTICS  
VERIFICATION FOR NATL BASIN 2020

## Intensity skill

MODEL FORECAST – INTENSITY RELATIVE SKILL (%) STATISTICS  
VERIFICATION FOR NATL BASIN 2020

HAFS-E has comparable track skill with HAFS-A and HAFS-J till Day-3, but lower thereafter. HAFS-E has lowest intensity errors for extended lead times for Days 3-5.

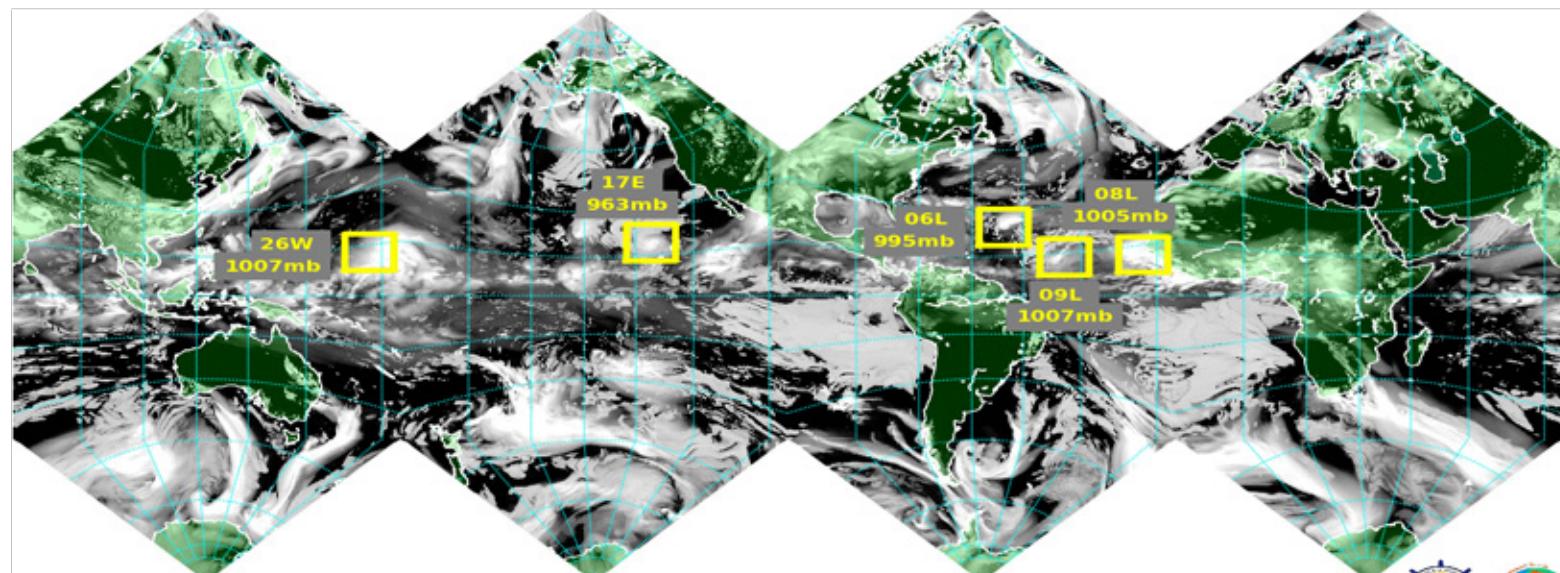

# HAFS -- Ongoing Developments

- Integrate HAFS developments for improved analysis and forecasts:
  - Leverage UFS global and UFS-CAM DA developments
  - Build a modular DA workflow for HAFS
  - Moving Nest Algorithms in FV3 -- Dynamics and Physics
- Accelerate our ability to initialize Hurricane vortex and its environment with advanced DA methods (FY21 and FY22, development and evaluation)
  - New data ingestion and quality control methods
  - New DA algorithms and technologies for inner-core (vortex-scale) DA
- Enhance physics for Hurricane Application
  - PBL, Microphysics, Radiation, Surface physics, and the interactions among schemes
- Conduct experiments with the above advancements for improved analysis and forecast skill

# Long-term Target for HAFS/GFS

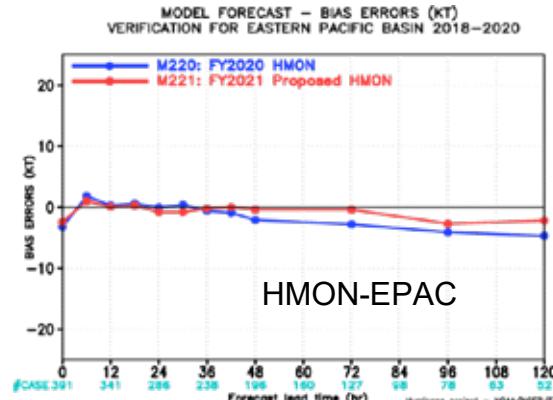

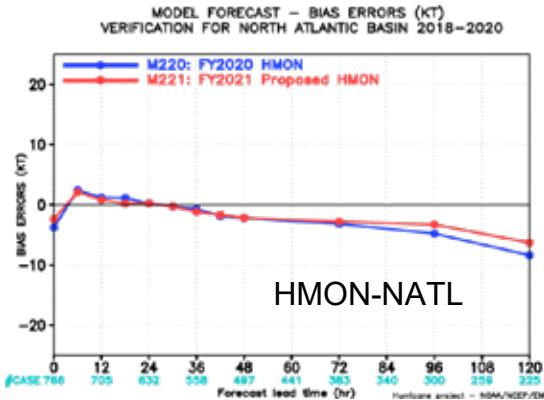

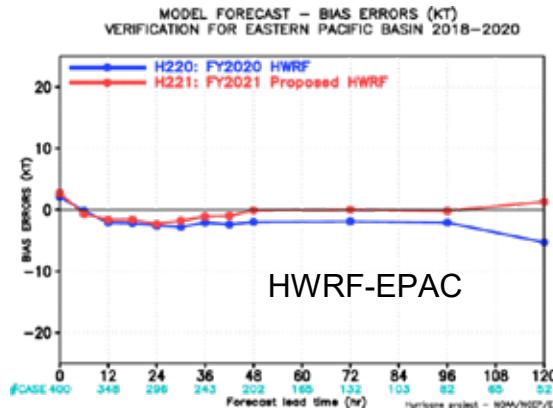

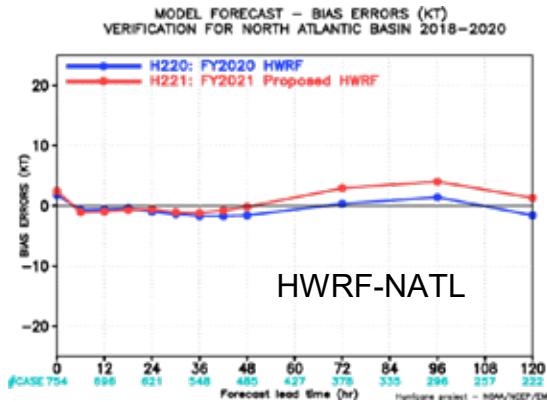

**06L: Florence; 08L: Helene; 09L: Isaac; 17E: Olivia; 26W: Mangkhut**

# Thank You !

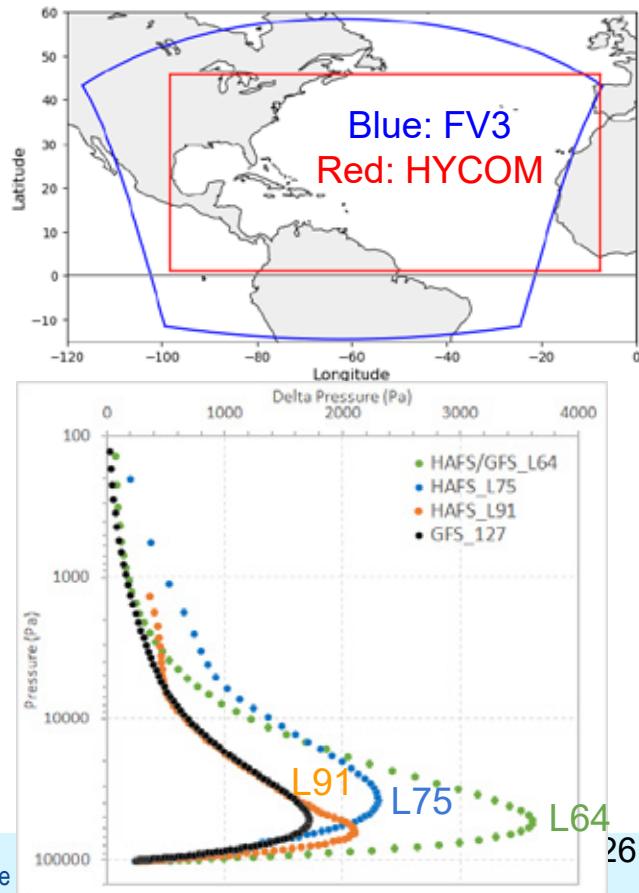

# Model Intensity Bias Comparisons

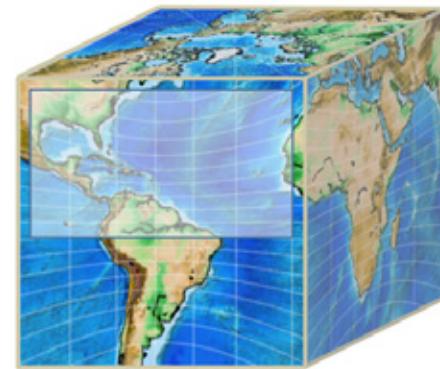

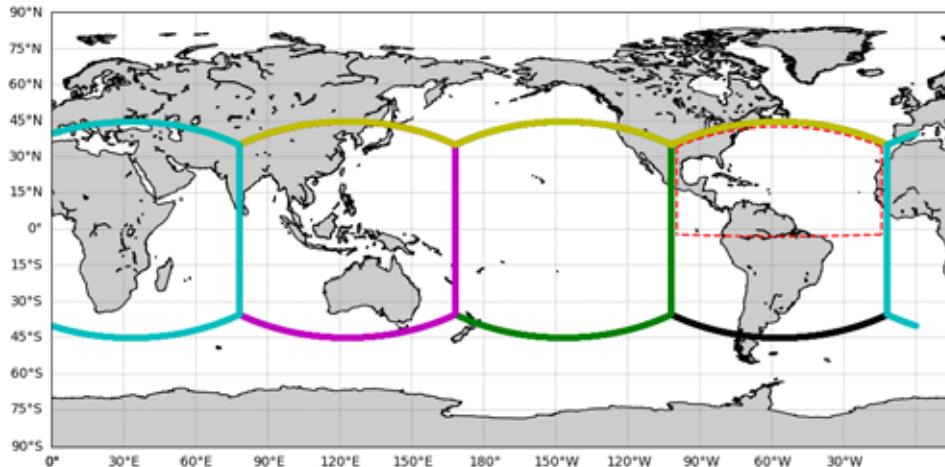

# The HAFSv0.1A Configuration

- The FV3 component (based on 2019 HAFS.v0.0A)
  - FV3 model domain (~85x72 deg)
  - 91 vertical levels from
  - Use the HAFS\_V0\_gfdlmp\_nocpnsstugwd physics suite
    - GFDL microphysic; RRTMG radiation; No CP; Noah LSM; GFS surface layer with HWRF exchange coefficients; GFS EDMF PBL with HWRF modification; Both convective and orographic GWD are turned off; **Turning off the NSST component**
  - GFS NEMSIO file for IC; 3-hrly GFS grib2 files for LBC
- The HYCOM ocean model component
  - Cover NATL basin (1-45.78N, 261.8-352.5E) at a 1/12-degree resolution with 41 vertical layers
  - Ocean IC from RTOFS nowcast and/or forecasts
  - Use persistent oceanic LBC
  - Atmospheric forcing from 0.25-degree GFS grib2 files to cover non-overlapped area

# The HAFSv0.1B Configuration

- One static nest over the Atlantic.
- Use “tropical channel” global layout of FV3.
- Forecasts length of 174 hours (7.25 days) in order to provide 7-day interpolated forecast .
- Include results for the global domain, to allow for direct comparison with operational GFS; assess impact of the nest on the global domain through 2-way feedback.
- Physics and dynamics options similar to HAFS v0.B in 2019, upgrades to PBL physics.

**Goal:** In addition to facilitating comparisons with operational and experimental model guidance, assess impact of high-resolution nests in HAFS on the global circulation, as well as feedback of the nests on each other.

# The HAFSv0.1E Configuration

## ➤ Basic configuration, based on HAFSv0.1A

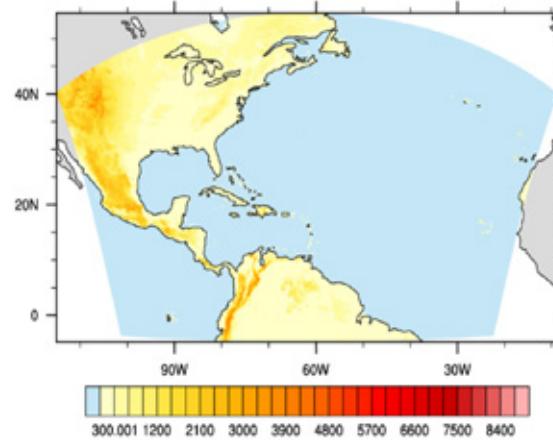

- One control member plus 17 perturbed ensemble members
- Coarser resolutions: ~6km vs. 3km; L64 vs. L91
- Cumulus parameterization on
- Twice a day (00Z and 12Z), Atlantic basin only

## ➤ IC/BC Perturbation:

- IC/BC: GEFS grib2 (0.5x0.5)

## ➤ Model Physics:

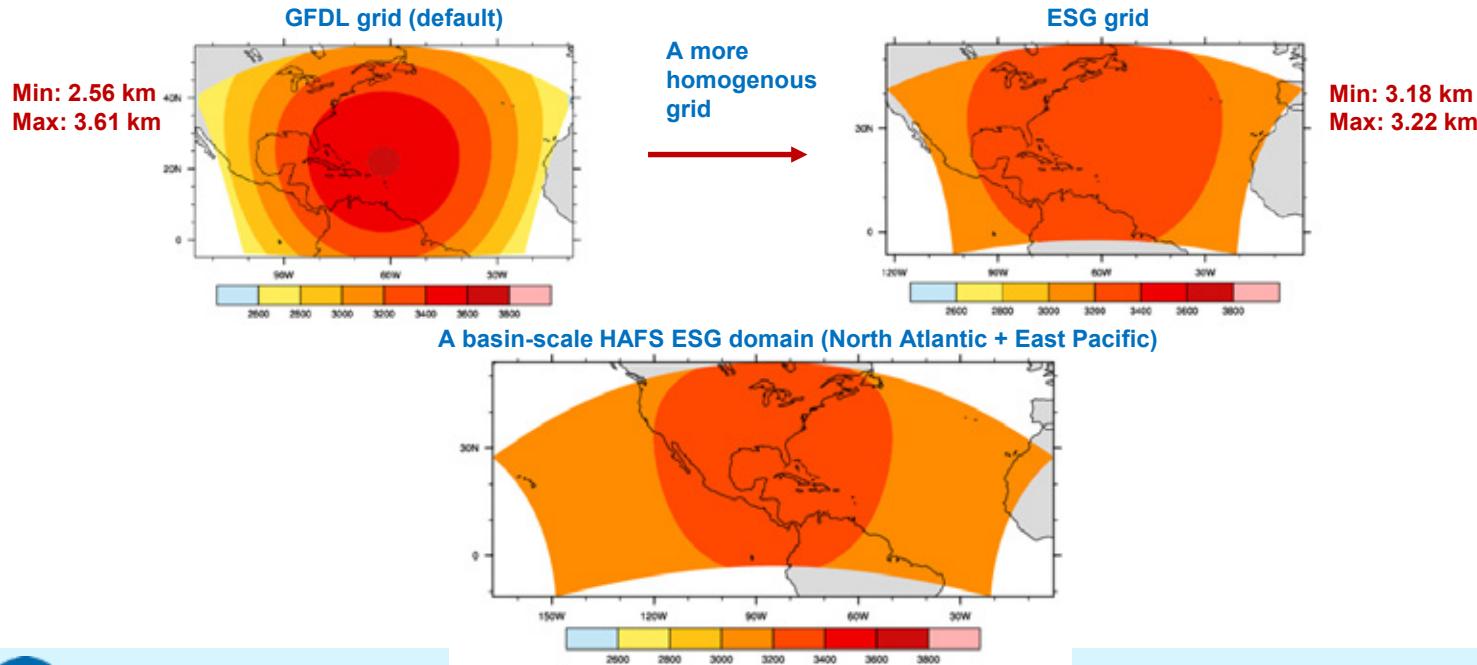

- Stochastic kinetic energy backscatter (SKEB)
  - Counteract excessive energy dissipation from numerical diffusion and in wave drag, and deep convection
  - Stream function is randomly perturbed to represent upscale kinetic energy transfer
- Stochastically perturbed physics tendencies (SPPT)
  - Represents uncertainties in physical parameterizations
  - Multiplicative noise modifies total parameterized tendency
- Stochastically perturbed PBL humidity (SHUM)
  - Represents variability in the sub-grid humidity field
  - Similar to SPPT, but directly modifies low-level humidity field instead of tendency

# HAFS v0.1J with ESG (Extended Schmidt Gnomonic) grid

## - a more uniform grid for HAFS

- The default GFDL grid has non-uniform resolution over a large Atlantic domain: coarser resolution in the center; higher resolution over edges
- A more homogenous grid allows larger timestep; not necessarily limited by the minimum resolution in GFDL grid
- Easy design for large domains (e.g. basin-scale HAFS)
